Fluids Perception Survey due tonight

WP login due tonight: Go to flowvis.org/wp-admin. Put in your `firstname.lastname@colorado.edu` email, and click 'forgot password'. If that doesn't work, see cyron.completo@colorado.edu

Last time:

Make CHOICES:

1. Flow phenomenon: Water boiling? Faucet dripping?
 - Why does it look like that: Consider FORCES:
 - Body forces: gravity, magnetism, surface tension
 - Surface forces: Pressure (normal, perpendicular), and shear (parallel to surface)
2. Visualization technique: Add dye? See light distorted by air/water surface?
3. Lighting (source of worst image problems)
4. Image acquisition: Still? Video? Stereo? Time lapse? High speed?
5. Post processing, final output. Edit, at least crop the image, consider contrast.

All forces can be categorized like this: 2 types of forces

← Body

Acts directly on every molecule equally

- a) Gravity
- b) Electromagnetics

↓ Surface

Acts on the surface of a volume of fluid

P Pressure: always perpendicular to surface

τ Shear: always parallel to surface

Any surface force can be decomposed into a shear plus pressure

Note: these are actually STRESSES =

Force acting on an area.

The only force that is not so easily categorized
is SURFACE TENSION

It's the result of **intermolecular** forces, so it affects every molecule, like a body force

But it is only obvious at interfaces between fluids, kind of like a surface force.

<http://upload.wikimedia.org/wikipedia/commons/thumb/f/f9/Wassermolek%C3%BCleInTr%C3%B6pfchen.svg/300px-Wassermolek%C3%BCleInTr%C3%B6pfchen.svg.png>

<http://www.flowvis.org/category/flow-categories/marangoni/>

Conclusion: Whenever you are observing fluids, list the forces that may be acting, ***that make it look like that.***

2. Visualization Techniques

- a. Seeded Boundary techniques
- b. Index of refraction (light bending)
- c. Particle tracking

a. Seeded Boundary techniques:

One fluid is seeded with dye or particles which scatter or absorb light. The other fluid is transparent, not scattering or absorbing light. The boundary can be seen.

Stage fog illuminated by a sheet of laser light forms a suddenly started laminar planar jet at $Re = 330$. Tanner Ladtchow, Geneva Wilkesanders, Tim Read, Andrea Fabri. Team Project 3, 2006

India ink falling through water shows the Rayleigh-Taylor instability. Gordon Browning. Get Wet Fall 07.

Back-lit. Dark ink absorbs light.

http://www.colorado.edu/MCEN/flowvis/galleries/2009/Team-1/FV_popup1-21.htm

Lucy Dean, Joseph Duggan, Tim Jarrell, Melissa Lucht

White gas (naphtha) pool flame.
Team 1 Spring 2009

Light emission shows hot soot region
Black body radiation: Red to yellow to white

Blue = specific emission from C_2 or CH radicals

Seeded boundary technique is characterized by dense seeding, can't see individual particles:

- Dye = food coloring
- Hydrogen bubbles (in water)
- Smoke
- Water droplets (clouds, fog)

Van Dyke book: An Album of Fluid Motion

This is a relatively easy technique.

Remember, choose environmentally benign fluids: foods, personal care products. No chemicals down the drain here.

b. Index of refraction techniques

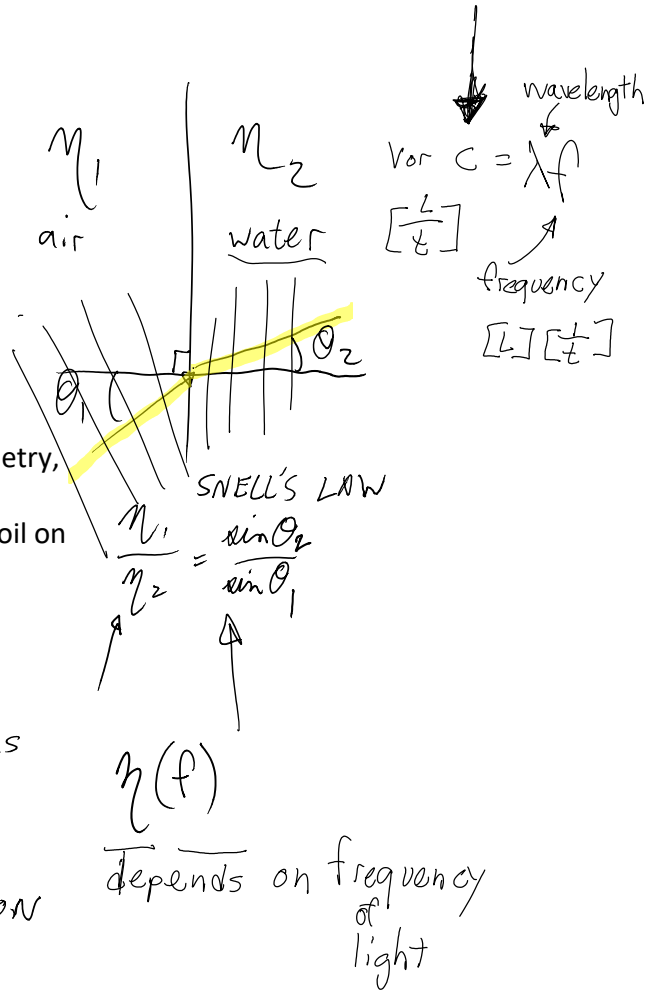

Minute paper, in groups: What is the index of refraction?

$$n = \frac{c}{v} = \frac{\text{Speed of light in vacuum}}{\text{Speed of light in medium}}$$

setah

- = 1.5 for glass
- = 1.3 for water, plexiglas, approximately
- = 1.00029 in air

Specific techniques: schlieren, shadowgraphy, interferometry, holography,
Free liquid/gas surfaces, thin film effects (soap bubbles), oil on puddles

Pasted from <http://www.colorado.edu/MCEN/flowvis/galleries/2007/assignment4/hnath.jpg>

A rectangular tank, partially filled with water, was tipped on edge. Sunlight projected through the water's edge to the ground, resulting in Moiré interference patterns : CAUSTICS.

Owen Hnath, Gordon Browning, Tracy Eliasson, Travis Gaskill, Trisha Harrison
 Team 2, 2007

SUNLIGHT ~ ALMOST PARALLEL LIGHT RAYS

Contact line: solid, fluid and gas meet together. Mathematically makes a singularity; very interesting to applied math folks.

Examples? Let's look at
